

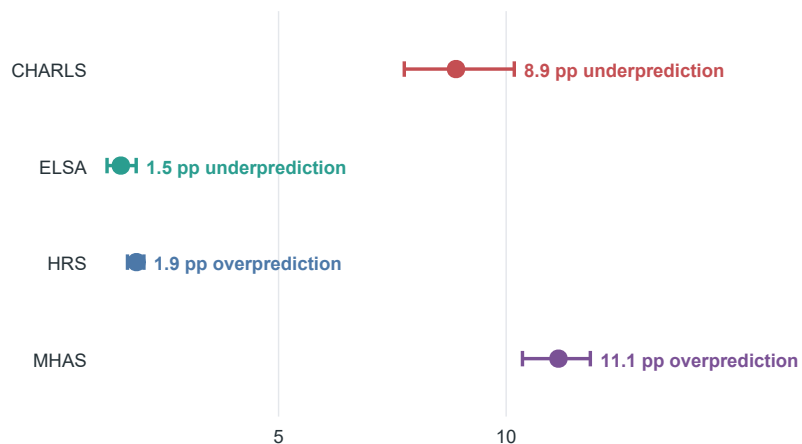

Figure 4. Updating added decision value mainly in markedly miscalibrated targets

A Pre-update absolute probability error

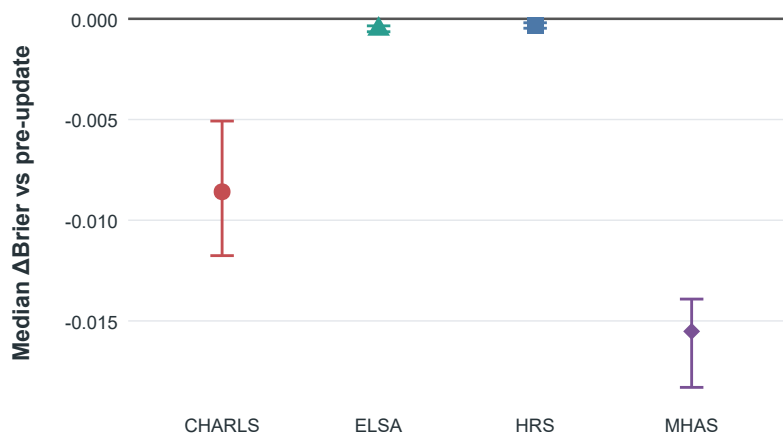

Dots and 95% CIs; labels show error direction.

Absolute observed-predicted risk gap, percentage points

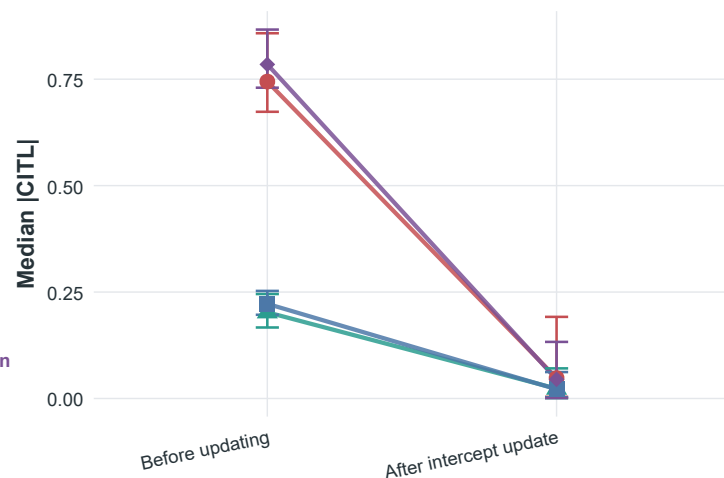

C Overall accuracy after updating

Negative values favor intercept updating.

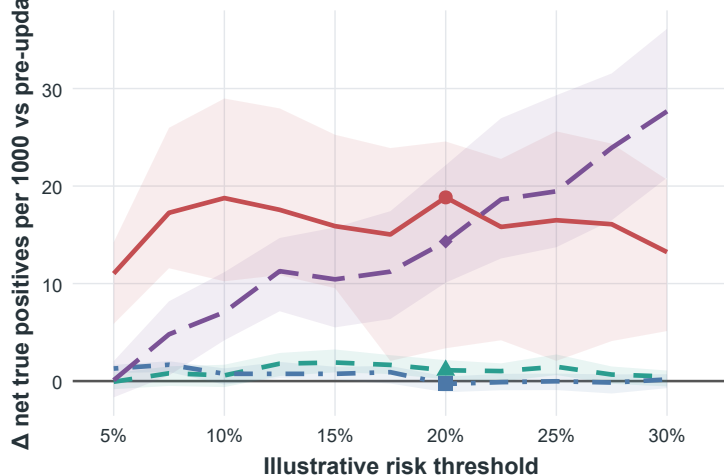

B Calibration error before vs after updating

Largest tested calibration fraction; 30 disjoint outer evaluations.

D Decision value in disjoint evaluation

Empirical 2.5th-97.5th percentiles across 30 outer splits; ordering varies by threshold.
